## AP-GfK Poll Methodology

The Associated Press-GfK Poll was conducted September 13 - 17, 2012 by GfK Roper Public Affairs \& Corporate Communications - a division of GfK Custom Research North America. This telephone poll is based on a nationally-representative probability sample of 1,512 general population adults age 18 or older.

Interviews were conducted with 906 respondents on landlines and 606 respondents on cellular telephones. Both the landline and cell phone samples were provided by Survey Sampling International. The sample included the contiguous 48 states, Alaska, and Hawaii. Interviews were conducted in both English and Spanish, depending on respondent preference.

The combined landline and cell phone data were weighted to account for probabilities of selection, as well as age, sex, education and race, using targets from the March 2009 supplement of the Current Population Survey. In addition to these factors, the weighting takes into account the patterns of land and cell phone usage by region from the 2009 Fall estimates provided by GfK MRI Inc.

The margin of sampling error is plus or minus 3.2 percentage points at the $95 \%$ confidence level, for results based on the entire sample of adults. The margin of sampling error is higher and varies for results based on sub-samples. In our reporting of the findings, percentage points are rounded off to the nearest whole number. As a result, percentages in a given table column may total slightly higher or lower than $100 \%$. In questions that permit multiple responses, columns may total significantly more than 100\%, depending on the number of different responses offered by each respondent.

Trend data are displayed for selected questions from previous AP-GfK Polls that also consisted of telephone interviews with nationally-representative probability samples of adults age 18 or older. Details about all AP-GfK Polls are available at http://www.ap-gfkpoll.com.
